Virtual Power Plants in PJM

A review of the ERCOT journey and potential applications within the PJM Footprint

COPYRIGHT 2022 TESLA INC.

Background: ERCOT

Two Tesla-managed (and supplied) Virtual Power Plants* participate in ERCOT's energy and ancillary service markets

- Assets: \bullet
 - Approximately 400 residential battery electric \bullet storage systems (Powerwalls) are dispatched by ERCOT for energy and ancillary services
 - Participants in each asset must have the same Transmission/distribution provider and must be within the same Load Zone.
 - Geographically, these aggregations are in Dallas • and Houston
 - Electrically, these premises are served by \bullet Centerpoint in the Houston Load Zone and Oncor in the North Load Zone
- Telemetry:
 - ERCOT requires that all assets communicate with the ISO by way of their Qualified Scheduling Entity (QSE)
 - All individual assets communicate with Tesla, lacksquareTesla aggregates asset availability and response data streams with their QSE

The above graphic depicts the aggregation behavior, including premise load, on site solar, battery charge / discharge in response to ISO instructions.

*VPPs in ERCOT's Pilot Program are known as Aggregated Distributed Energy Resources, Abbreviated as ADER

ADER Pilot Journey

To create, register, and qualify a new type of reacter new pathways.

New Coordination and Enrollment Pathways

- New Processes Established for Coordination with TDSPs, Enrollment Screening, Interconnection Review
- Updating ERCOT's registration portal (RIOO) and completing new ERCOT and PUC Documentation

Technical Challenges related to Telemetry and Dispatch

- Communicating with individual devices and creating pathways for aggregating and delivering the information
- Creating dynamic information about availability of the resource to accommodate customer's use
- Developing measurement and verification with the ERCOT ISO (Device-telemetry and real-time SOC)
- Refining dispatch control systems to perform with traditional resource accuracy (or better)
- Building toward a standard for 3rd party participation

Development of customer offers and experiences

- Customer engagement, marketing and value proposition. Including enabling customer control.
- Creating and implementing customer incentives and compensation

To create, register, and qualify a new type of resource, ERCOT, TDSPs, Tesla, and others had to

s, Enrollment Screening, Interconnection Review leting new ERCOT and PUC Documentation

thways for aggregating and delivering the information resource to accommodate customer's use OT ISO (Device-telemetry and real-time SOC) tional resource accuracy (or better)

n. Including enabling customer control.
mpensation

Lessons Learned – Unexpected Challenges

that will make qualifying smoother for future aggregations

ADER is the top of the Grid Service stack for Distributed Energy Resources There are different levels of service from a VPP. Market integrated VPPs will unlock highest grid value

3) Market Integration to Expand Services and Increase Grid Value

- Market Integrated VPPs (like ADERs) communicate their behavior and intentions to the market operator
- This unlocks additional services and value but more importantly makes the VPP more useful and reliable in grid operations

2) Response to Scarcity Signals from the Grid Operator

- Aggregated DERs provide additional support by exporting more during grid needs
- Motivates the DERs to provide additional capacity when most valuable
- Examples include peak energy prices or 4CP

1) Permanent Load Shift From Static information In Rates

- The most basic grid support from DERs comes from responding to time varying rates
- This modifies the sites consumption profile every day to reduce impact during peak times

Customer Experience of ADER Focus on Transparency and Control

- Event participation is visible
- Provide customers with the \bullet information they need to understand
- Customer control through configuring settings like Backup Reserve
- Offers that integrate ADER will continue to evolve and improve

TESLA

Tesla Electric VPP Beta

You have been auto-enrolled in a year-round Virtual Power Plant program offered by Tesla Electric. This program is designed to reward customers for helping reduce electric grid strain.

Virtual Power Plant Details

Your Powerwall is participating in a VPP pilot program with other Tesla Electric owners to support the ERCOT electric grid.

System Behavior

Your system will dispatch energy to the grid when ERCOT needs grid support. On some days, you may notice that your system reserves more Powerwall charge between 1-5pm for this purpose.

Compensation

In addition to your normal Sellback credits, you will earn \$10/month per Powerwall for your participation. You'll see this represented as a credit line-item on your monthly electric bill.

Considerations for the PJM Region

Tesla filed comments to propose a glide path to enhanced VPP Participation Under PJM's Proposal:

- aggregations / provide ancillary services
- 2.

3. unnecessary until participation is at an extraordinary scale

Participation in ancillary services should not be considered as double counting

Tesla's Powerwall device has premise, solar, and device level metering with ANSI C12 accuracy

TESLÄ
