NERC TPL-007-4 R3
GMD Steady State Voltage Performance

Stan Sliwa
Lead Engineer, Transmission Planning
Reliability Standards & Compliance Subcommittee
July 22, 2022
• Each responsible entity, as determined in Requirement R1, shall have criteria for acceptable System steady state voltage performance for its System during the GMD events described in Attachment 1.

<table>
<thead>
<tr>
<th>Category</th>
<th>Initial Condition</th>
<th>Event</th>
<th>Interruption of Firm Transmission Service Allowed</th>
<th>Load Loss Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Benchmark GMD Event – GMD Event with Outages</td>
<td>1. System as may be postured in response to space weather information, and then 2. GMD event</td>
<td>Reactive Power compensation devices and other Transmission Facilities removed as a result of Protection System operation or Misoperation due to harmonics during the GMD event</td>
<td>Yes³</td>
<td>Yes³</td>
</tr>
<tr>
<td>Supplemental GMD Event – GMD Event with Outages</td>
<td>1. System as may be postured in response to space weather information, and then 2. GMD event</td>
<td>Reactive Power compensation devices and other Transmission Facilities removed as a result of Protection System operation or Misoperation due to harmonics during the GMD event</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Table 1: Steady State Planning GMD Event

Table 1: Steady State Performance Footnotes

1. The System condition for GMD planning may include adjustments to posture the System that are executable in response to space weather information.
2. The GMD conditions for the benchmark and supplemental planning events are described in Attachment 1.
3. Load loss as a result of manual or automatic Load shedding (e.g., UVLS) and/or curtailment of Firm Transmission Service may be used to meet IES performance requirements during studied GMD conditions. The likelihood and magnitude of Load loss or curtailment of Firm Transmission Service should be minimized.
Steady State Voltage Criteria

• Steady state voltage criteria established pursuant to:
  – PJM Manual 03: Transmission Operations
    • Section 3: Voltage & Stability Operating Guidelines
  – PJM Manual 14B: PJM Region Transmission Planning Process
    • Section 2: Regional Transmission Expansion Plan Process
  – PJM Manual 39: Nuclear Plant Interface Coordination
    • Section 1: Nuclear Plant Interface Requirements
Steady State Voltage Performance: Stages

- Voltage performance during GMD events are examined in three stages:
  - **Stage 1** Initial Condition
    - System postured in response to space weather information
  - **Stage 2** GMD Event
    - GMD event occurs but prior to loss of elements per Event description in Table 1 of TPL-007-4
  - **Stage 3** GMD Event with Outages
    - Loss of reactive power compensation devices and other Transmission Facilities as a result of Protection System operation / misoperation
Stage 1: Initial Condition

- System may be postured in anticipation of a GMD event
  - Adjustments made that are executable in response to space weather information
- Steady state voltage performance shall be consistent with:
  - Category P0 (No Contingency) per the TPL-001 standard
- Voltage limits applied during Stage 1 will be the same as applied in PJM Operations for normal scenarios
  - Normal Low (NL) and Normal High (NH) baseline voltage limits as per Manual 03: Transmission Operations, Section 3
Stage 2: GMD Event

• The effects of GMD are modeled as reactive losses on the transmission system
  – Reduced voltages are expected
• Steady state voltage performance shall be consistent with:
  – Category P1 (Single Contingency) per the TPL-001 standard
• Voltage limits applied during Stage 2 will be the same as applied in PJM Operations for contingency scenarios
  – Emergency Low (EL) and Emergency High (EH) baseline voltage limits as per Manual 03: Transmission Operations, Section 3
Stage 3: GMD Event with Outages

• Facilities susceptible to harmonics are removed from service as a result of protection system operation / misoperation
• Voltage limits applied during Stage 3 will be the Load Dump limit used in PJM Operations
  – Load Dump (LD) baseline voltage limit as per Manual 03: Transmission Operations, Section 3
Steady State Voltage Performance
Before and During GMD Event

• All PJM Transmission System facilities 100 kV and greater will be monitored
• Cascading, Voltage Collapse and Uncontrolled Islanding shall not occur
• Nuclear Plant Interface Requirement (NPIR) voltage limits respected
• TO criteria if more restrictive than baseline voltage limits will be used instead
